orthodontic therapy

Pasin-Pin®

The modern approach to successful orthodontic therapy

The Pasin-Pin® System opens up new options for state-of-the-art orthodontic therapy. It redefines the limits of orthodontics, making the impossible possible. Our Mini-Pins now allow orthodontists to use an innovative therapeutic approach, ensuring safe and reliable treatments even in complex cases of tooth malposition.

The Pasin-Pin® System is used to achieve more effective tooth movements in orthodontics. It provides patients with invisible braces, which do not require any active cooperation.

The Pins are placed under local anaesthesia. This means the procedure is painless, and there is no bleeding. An incision in the mucosa is not necessary.

Usually Pin placement takes only a few minutes. After placement, there may be a feeling of pressure for a little while, and in rare cases there may be a slight swelling.

Advantages:

- Helps to avoid removing permanent teeth
- Enables tooth movements that would otherwise be impossible
- Shortens orthodontic treatment time
- Features an invisible brace
- Does not require any cooperation
- Safe and reliable to use
- Low-risk technique
- Very high biocompatibility thanks to the use of titanium
